Click.to Brings Simple, Fast Sharing with New Box Integration
Access Box Accounts with One Click

Karlsruhe, Germany, August 22, 2011 - click.to, the new software program developed by Axonic Informationssysteme GmbH, has integrated the services of Box, the leader in simple and secure content sharing (formerly Box.net), to improve its information sharing function. The company used Box's open APIs to develop a solution that simplifies sharing and speeds up collaboration and productivity with one click.

"Cloud computing and data storage is the future," says Peter Oehler, COO at Axonic. "As a young company, we are very happy when we can bring the cloud closer to our users, thereby speeding up the process of information sharing. The new Box action goes a long way in accomplishing this goal."

"Box is committed to providing ways for people to share, manage and access their content from anywhere," said Chris Yeh, vice president of Box Platform. "The click.to integration is a perfect example of how companies can leverage the Box open APIs to build new applications that improve the way users share and collaborate."

The program works with a user's clipboard to augment the 'Copy & Paste' principle. click.to is activated every time the copy function is used. Users of Box can transfer files, text, pictures and presentations by simply highlighting the text or file, right clicking copy and selecting the Box icon that appears above the mouse cursor. The highlighted file will then be transferred to the user's account automatically by click.to. The click.to program, with integrated Box action, is free and available now to download at www.clicktoapp.com. It is available for Windows, with an Apple Mac version coming soon.

A Natural Fit
click.to services are designed to streamline the sharing of information across many platforms on a user's desktop, as well as online. Once the app is installed on a user's computer, all that's required is a right click-copy to initiate the software. The partnership with Box continues this streamlining process, improving information finding across the cloud and speeding up information sharing. In addition, the app is easily customizable and allows the user to collaborate with people in their network on stored files.

About Axonic
Axonic is a young company focused on information, communication and recognition technologies. The company is headquartered in Karlsruhe and was founded in 2003 by Martin Welker. For the last few years, Axonic's research and development has focused on "communication intelligence" - the targeted analysis, representation and simplification of communication.

About Box - Built for Business

Box's cloud content management platform makes it easy for 60,000 businesses and nearly 6 million users to share and collaborate across devices, while also providing the security, visibility and reporting capabilities required by IT departments. With today's announcement, users can quickly share content with one click, improving productivity and making sharing and collaboration simple.
