

### **click.to opens desktop and browser functions with one click**

With click.to, paths are shortened between applications. Many everyday actions that are performed on a PC make use of the clipboard. Using the copy and paste functions to transfer files, information, and text, and to start searches, can quickly result in a long series of actions in order to reach the target application. click.to users only need to know the desired use of the respective copied content and confirm the end application from a selection menu, and click.to will automatically open the browser, type in the website or open an email and paste the text. In short, click.to expands the copy and paste principle and provides logical links between all applications on the desktop and the Web "with one click."
